

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

CORRESPONDENCE

A letter written to Dr. T. C. Stephens by our fellow member, Dr. P. A. Taverner, of the Victoria Memorial Museum, Ottawa, Canada, is of such general interest that with the permission of both gentlemen it is reproduced here. Dr. Taverner says:

I have just returned from a field trip to the South Shore of the Gulf of St. Lawrence, for the Zoölogical Division of the Geological Survey of Canada. We spent a month from May 21st on Miscou Island, N. B., and then went to Percé, across the Bay of Chaleurs; where we spent the remainder of the season to August 23d, with side trips to Gaspe and a flying visit to the Magdalen Islands.

Most of the work after Miscou was put on sea birds and Bonaventure Island the famous Gannet breeding place, three miles from Percé was a mine of interesting experiences and at Gaspe we made an economic study of the Cormorant—*Phalacrocorax auritus*—in relation to the salmon fisheries and hope that incidentally we have gone far to stop the killing of these birds.

We obtained a fine series of skins of nearly all the sea species inhabiting these shores, showing the various summer plumages of the various ages.

We are also able to correct the generally reported identification that gives *P. carbo* as the breeding Cormorant of this section. They are in fact all *auritus*, and one of the interesting problems will be in future to map out the summer distribution of these two species on the St. Lawrence coasts.

Besides this expedition we have two others in the field yet. Dr. R. M. Anderson is collecting and second in command with the Canadian Arctic Expedition under Stephanson. Our latest reports from him were written last December, but at the time of his writing he was in good health and his collecting progressing most favorably and with the promises of most satisfactory results. Fortunately he was not with the ill-fated "Karlark," that was crushed in the ice and whose crew we are still anxiously waiting to hear of through the U. S. Revenue Ship Bear.

Mr. Francis Harper of Cornell, constitutes the Zoölogical section of another expedition crossing from Lake Athabasca to Great Slave Lake. His last report was dated Athabasca Lake, June 8th, when about to make the final traverse. His results so far seemed most satisfactory and doubtless his final report on return will continue the promise of the earlier work.

Yours sincerely,

P. A. TAVERNER.
